

#	Task	Classification	Rationale
1	Setting up breadboard circuits and hardware wiring	Just me	Physical hardware debugging requires manual manipulation and direct real-time bench testing.
2	Final exam problem solving and core engineering calculations	Just me	Mastering foundational principles and retaining core technical knowledge requires unassisted problem-solving.
3	Writing Python boilerplate code for data manipulation	Delegate to AI with review	LLMs generate boilerplate structures rapidly, requiring only quick verification of variable logic and schemas.
4	Debugging compiler warnings and syntax errors	Collaborate with AI	AI quickly points out root causes and edge cases in stack traces while I implement and test the fix.
5	Summarizing technical research	Delegate to AI with	Condensing long technical

	papers and documentation	review	documents saves time, though key methodologies must be manually verified.
6	Brainstorming IoT system architectures	Collaborate with AI	Evaluating trade-offs across architectural options with AI expands perspective before finalizing designs.
7	Drafting formal follow-up emails and correspondence	Delegate to AI with review	Drafting standard email templates is fast, but tone and recipient-specific details need manual review.
8	Formatting Markdown tables and documentation templates	Fully automate	Converting structured text into clean markdown tables and documentation follows deterministic formatting rules.
9	Writing unit test cases for data pipelines	Delegate to AI with review	AI generates test scenarios quickly, while manual review ensures full coverage of realistic edge cases.

10	Daily schedule planning and task prioritization	Just me	Prioritizing daily work requires personal judgment based on real-time context, workload, and focus.
11	Generating SQL query drafts for table operations	Collaborate with AI	Writing complex queries and joins is faster with initial AI scaffolding, followed by local verification.
12	Creating dummy JSON test data	Fully automate	Generating structured synthetic mock data for API and schema testing can be handled end-to-end with prompts.

The 3 Target Tasks for FL-02 through FL-04 & "Done Well" Definitions

- **Task 1: Python Data Pipeline & Feature Engineering Boilerplate**
 - *Done Well Definition:* Generates clean, bug-free, reproducible Pandas/Scikit-learn code handling missing values and data transformations without hallucinated methods, passing all syntax checks on the first run.
- **Task 2: Technical Paper & Documentation Synthesis**
 - *Done Well Definition:* Produces an executive technical breakdown identifying the core methodology, limitations, and reproducible mathematical formulations without generic summaries.
- **Task 3: Professional Technical Documentation & README Generation**
 - *Done Well Definition:* Formats raw experimental notes into clear Markdown documentation with installation steps, dependency requirements, and metrics tables matching real output values.
